

# Vaccinating animals protects their health, your health and that of our planet

## Why it must be an EU priority

We realise that people care about animal welfare and farming. That's why our industry encourages good farming practices, including applying preventative measures such as vaccination, to avoid illness and discomfort and improve the quality of life for farm animals. Preventive care also helps to ensure food safety and supports sustainable farming practices.

### Stopping disease at source

### How can we help?

Industry and authorities have already been successfully working together to address certain threats. With better collaboration we can more rapidly respond to and halt or slow transmission of transboundary emerging diseases to protect public health and our animals, our farming communities and our rural areas.

### Working together we can:

Improve surveillance

Improve preparedness

Strengthen animal disease prevention

### How can the EU further improve animal vaccination?

Incentivising the development of tools and infrastructure that support early detection, animal identification and prevent disease spread.

Promoting and supporting public acceptance of preventive health measures on farms such as biosecurity, surveillance and vaccination.

**Prevention Protects**
